CERTIFICATE

This is to certify that the mini project entitled

INTERNTRACK — INTERNSHIP APPLICATION TRACKER

has been successfully developed and submitted by **DHANUSH** (Roll No. **24BCA075**), a student of the 4th Semester, Bachelor of Computer Applications (BCA), St. Claret College (Autonomous), Bengaluru.

This mini project was developed independently as part of self-learning during the vacation period. The work is original and has not been submitted elsewhere for any academic examination or award.

St. Claret College (Autonomous), Bengaluru

DECLARATION

I, **DHANUSH**, Roll No. **24BCA075**, 4th Semester, BCA, St. Claret College (Autonomous), Bengaluru, declare that the mini project **“INTERNTRACK — INTERNSHIP APPLICATION TRACKER”** is a record of original work done by me during the vacation period.

I declare that:

- This project was carried out independently, without any formal institutional guidance.
- The work is genuine and has not been copied from any source without acknowledgement.
- This project has not been submitted for any degree or academic title elsewhere.
- All references have been duly cited and acknowledged.
- The conclusions drawn are based entirely on my own understanding and research.

Place: Bengaluru

Date: July 2026

Signature of the Student

DHANUSH

Roll No: 24BCA075 | 4th Semester, BCA

ACKNOWLEDGEMENT

I thank all those who encouraged and supported me throughout the development of this project.

I am grateful to the open-source developer community and educational resources available through MDN Web Docs, Stack Overflow, and YouTube, which guided my understanding of drag-and-drop Kanban board implementation, localStorage-based data persistence, JSON export/import, and modular JavaScript application design.

I thank my family for their constant support and encouragement throughout the vacation period.

Building a complete internship application tracking system — with a Kanban pipeline, dashboard analytics, global notes, data import/export, and status filtering — entirely in the browser was a deeply rewarding experience that significantly strengthened my practical front-end development skills.

DHANUSH

Roll No: 24BCA075 | 4th Semester, BCA

St. Claret College (Autonomous), Bengaluru

ABSTRACT

The internship and job application process is a critical phase for students and fresh graduates, yet it is largely managed through disorganised methods such as spreadsheets, notes, or memory. Tracking multiple applications across companies, monitoring their progress through different stages, and maintaining a structured record of notes and timelines is genuinely difficult without a dedicated tool. InternTrack addresses this problem by providing a purpose-built, browser-based internship application management system designed specifically for students.

InternTrack is a single-page web application comprising a Dashboard view, a Kanban Pipeline view, Global Notes, and a Settings panel. It allows students to log internship applications with full metadata, track their progress through five stages — Applied, Phone Screen, On-site, Offer, and Rejected — visualise their application pipeline, and export or import their data as JSON. All data is stored locally in the browser with no server or login required.

Key Features:

- Dashboard view: summary cards for Total, Applied, Interviews, Offers, and Rejected counts.
- Application list with search by company/role, filter by status, and sort by date or name.
- Quick Add and New Application forms for rapid entry of application details.
- Five application statuses with colour-coded indicators: Applied, Phone Screen, On-site, Offer, Rejected.
- Per-application metadata: company, role, date, location, interview rounds, notes, and status timeline dots.
- Pipeline (Kanban) view: drag-and-drop cards between five stage columns to update application status.
- Global Notes: a free-form note-taking area for interview prep, contacts, and reminders.
- Settings panel: Export Data (JSON), Import Data (JSON restore), and Clear All Data.
- Sidebar navigation with status-based filter counts and Export/Import quick actions.
- Fully client-side — no server, no login, all data in localStorage.

Technologies Used:

HTML5, CSS3, Vanilla JavaScript, Drag-and-Drop API, localStorage API. Deployed on Netlify.

INTRODUCTION

1.1 Background

For students actively seeking internships, the application process typically involves submitting applications to dozens of companies across multiple platforms — LinkedIn, company portals, Internshala, and direct email — over a period of weeks or months. Without a structured tracking system, it becomes difficult to remember which companies have been approached, at which stage each application stands, what was discussed in a phone screen, or when a follow-up is due.

Spreadsheets are the most common workaround, but they require manual maintenance, offer no visual pipeline view, and cannot filter or search applications by status efficiently. InternTrack provides a purpose-built alternative.

1.2 About the Project

InternTrack v1.0 is a fully client-side internship application management tool with a dark, developer-oriented interface. It provides two primary views — a list-based Dashboard and a Kanban Pipeline — along with Global Notes and a Settings panel for data management. The application is designed to serve as a student's personal command centre for the internship hunt.

Live at: **https://intern-track-v1.netlify.app/** — deployed on Netlify.

1.3 Scope

- Full application lifecycle management from Applied through Offer or Rejected.
- Dual view modes: list-based Dashboard and drag-and-drop Kanban Pipeline.
- Search, filter by status, and sort by date or name.
- Global Notes for interview preparation and contact management.
- JSON export and import for data portability and backup.
- All data persisted locally — no server, no login required.

OBJECTIVES OF THE PROJECT

The following objectives guided the design and development of InternTrack:

1. To provide a centralised internship application tracker: Build a single platform where students can log, manage, and monitor all their internship applications with full metadata in one place.

2. To implement a visual Kanban pipeline: Provide a drag-and-drop Kanban board with five stage columns — Applied, Phone Screen, On-site, Offer, and Rejected — so students can visually track the status of each application and update it by dragging cards between columns.

3. To enable efficient application discovery: Implement real-time search by company name or role, status-based filtering via the sidebar, and sort options (by date or name) for rapid navigation of large application lists.

4. To support structured application metadata: Capture rich per-application data including company name, role, application date, location, number of interview rounds completed, status notes, and a visual timeline of progress dots.

5. To provide a global note-taking facility: Offer a dedicated Global Notes section for free-form text storage, allowing students to maintain interview preparation notes, recruiter contacts, and general job-search reminders.

6. To ensure data portability and backup: Enable full data export as a JSON file and restore from a previously exported JSON backup, giving students complete control over their data.

7. To deliver a developer-oriented, distraction-free interface: Design a clean dark UI with cyan accents and monospace typography that appeals to a technically-minded student audience and minimises visual clutter.

EXISTING SYSTEM

3.1 Current Application Tracking Methods

Students currently rely on the following methods to manage internship applications, each with significant limitations:

a) Spreadsheets (Google Sheets / Excel)

The most common approach. Students manually maintain columns for company, role, date, status, and notes. However, spreadsheets offer no visual pipeline, no status-based filtering, no drag-and-drop status updates, and require consistent manual maintenance to remain useful.

b) Generic To-Do or Note Apps

Apps like Notion, Trello, or Todoist can be repurposed for application tracking but require significant setup time, are not optimised for this specific use case, and often include unnecessary features that create noise.

c) Email Inbox Tracking

Many students rely on their email inbox as the de facto tracker, searching for company names when needed. This approach fails completely for applications submitted via portals that do not send confirmation emails, and offers no pipeline view or status categorisation.

d) Commercial ATS Tools

Tools like Huntr, Teal, or Simplify offer job application tracking but require account creation, store data on external servers, and often have limited free tiers. They are not purpose-built for Indian students seeking internships.

3.2 Limitations Summary

- No free, instant, browser-based internship tracker without account creation.
- Spreadsheets lack visual pipeline views and drag-and-drop status management.
- Generic tools require setup and are not optimised for internship tracking.
- Commercial tools store data on external servers and have limited free tiers.
- No tool combines a list dashboard, Kanban pipeline, and notes in one lightweight app.

PROPOSED SYSTEM

4.1 Overview

InternTrack proposes a fully browser-based, client-side internship application tracking tool that provides a structured dashboard, a drag-and-drop Kanban pipeline, a global notes section, and complete data export/import — all without any server, account, or installation requirement.

4.2 Advantages

- **Purpose-Built for Students:** Designed specifically for the internship application workflow, with statuses, metadata fields, and views that match the actual process.
- **Dual View Modes:** Dashboard list view for quick scanning and Pipeline Kanban view for visual stage management — two complementary perspectives on the same data.
- **Drag-and-Drop Status Updates:** Moving an application card between Pipeline columns updates its status instantly, without opening a form.
- **Zero Setup:** Open the URL and start adding applications immediately. No account, no login, no configuration.
- **Complete Data Privacy:** All application data is stored in the user's browser via localStorage. Nothing is sent to any server.
- **Data Portability:** Export all data as JSON for backup; restore from JSON when switching devices.

4.3 Architecture

InternTrack is a single-page application with a persistent left sidebar and a dynamic main content area. Navigation between Dashboard, Pipeline, Global Notes, and Settings is handled by JavaScript show/hide toggling. All application data is stored as a JSON array in localStorage and re-rendered on every state change. The Pipeline view uses the HTML5 Drag-and-Drop API for card movement between columns.

MODULES AND FEATURES

InternTrack comprises four modules accessible via the left sidebar navigation.

5.1 Dashboard Module

The Dashboard is the default view and serves as the primary application management interface. It is divided into a summary statistics bar and a searchable, filterable application list.

Summary Cards:

Five metric cards at the top display: Total applications, Applied count, Interviews count, Offers count, and Rejected count — each with a colour-coded top border (blue, yellow, green, red) corresponding to the status colour system.

Application List:

Each application entry shows the company name, role, application date, location, interview rounds, a status badge (e.g., APPLIED, PHONE SCREEN, ON-SITE), and a three-dot progress timeline. A notes line below shows the most recent status update or user note.

Controls:

- **Search:** Real-time filter by company name or role.
- **All Statuses dropdown:** Filter the list to a specific status.
- **Sort:** Switch between Date and Name ordering.
- **Quick Add:** Rapid application entry form.
- **+ New Application:** Full application detail form.

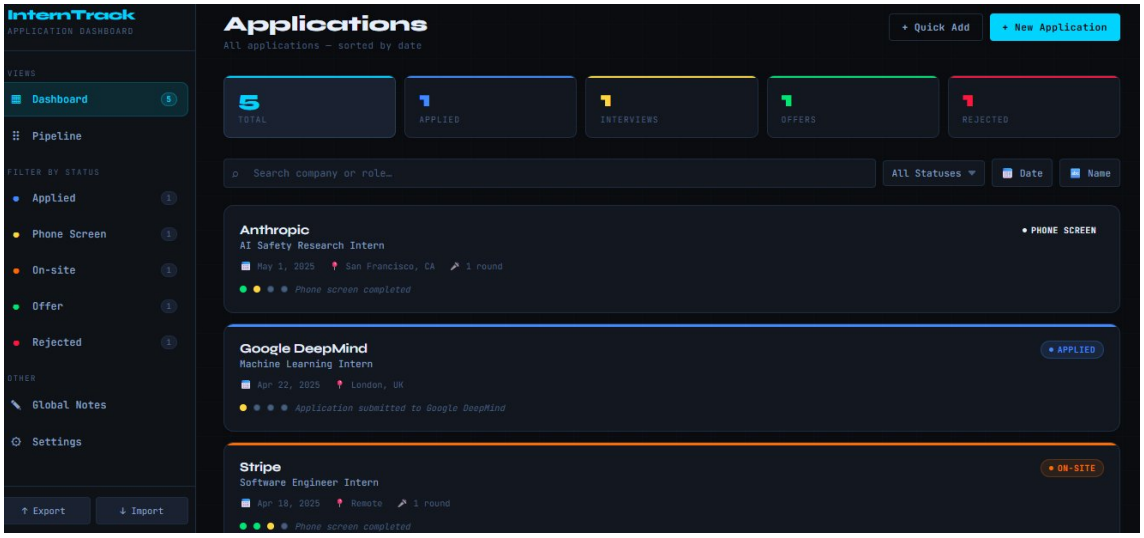

Figure 5.1 – Dashboard Module with Summary Cards and Application List

5.2 Pipeline (Kanban) Module

The Pipeline module presents all applications as draggable cards organised into five vertical stage columns: Applied, Phone Screen, On-site, Offer, and Rejected. Each column header displays its colour-coded status dot, the column name, and the current card count.

Drag-and-Drop Status Update:

Cards can be dragged from one column and dropped into another to update the application's status instantly. The change is persisted to localStorage immediately and reflected in the Dashboard view as well. This provides an intuitive, visual alternative to manually editing each application.

Card Information:

Each pipeline card displays the company name (bold), role, and application date — sufficient context for status management without overwhelming detail.

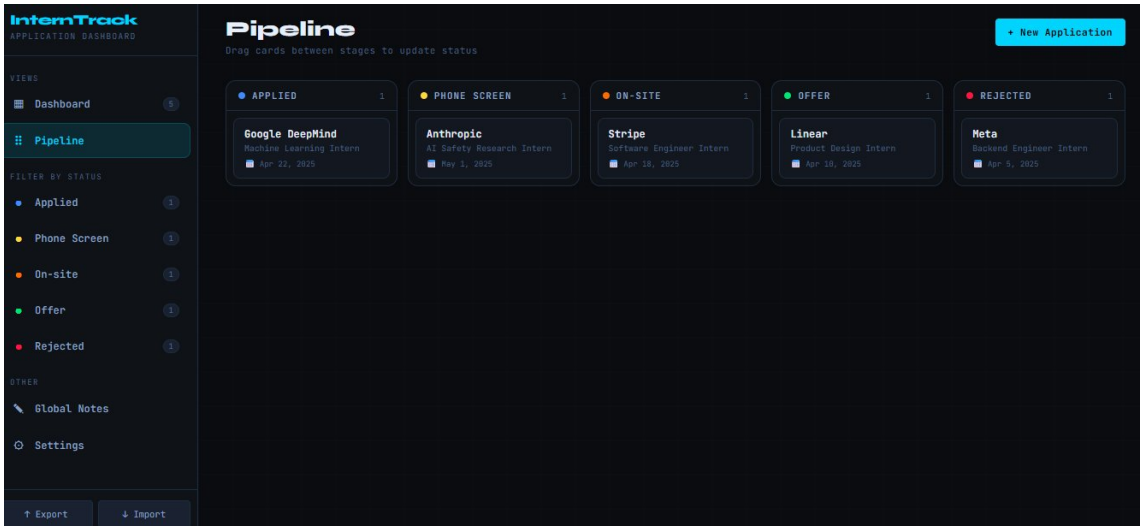

Figure 5.2 – Pipeline Module with Drag-and-Drop Kanban Stage Columns

5.3 Settings Module

The Settings module provides data management tools under the DATA MANAGEMENT section:

- **Export Data:** Downloads all application data as a JSON file, providing a complete backup of the user's internship tracker.
- **Import Data:** Restores data from a previously exported JSON file, enabling the user to migrate their tracker to a new device.
- **Clear All Data:** Permanently removes all applications and notes from localStorage after user confirmation.

An ABOUT section displays the application version (InternTrack v1.0) and confirms that it is a single-page app with all data stored locally in the browser.

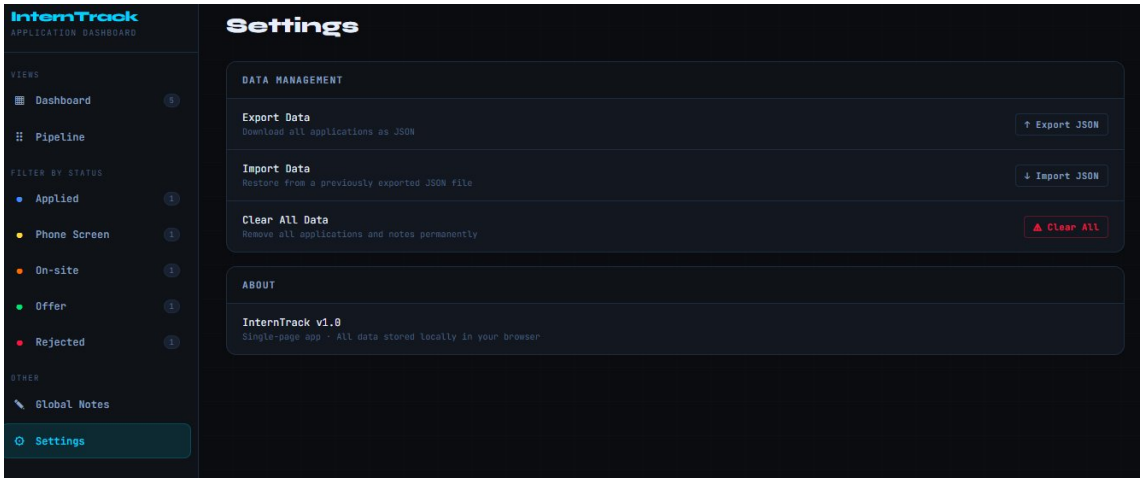

Figure 5.3 – Settings Module with Data Management and About Section

5.4 Sidebar Navigation and Global Notes

Sidebar:

The persistent left sidebar provides: the InternTrack brand with APPLICATION DASHBOARD subtitle; VIEWS section with Dashboard (showing total count badge) and Pipeline links; FILTER BY STATUS section listing all five statuses with individual counts; and OTHER section with Global Notes and Settings links. Export and Import quick-action buttons appear at the bottom of the sidebar.

Global Notes:

A dedicated free-form text area accessible from the sidebar, allowing students to store interview preparation notes, recruiter contact details, salary research, and any other job-search information that does not belong to a specific application. Notes are persisted to localStorage automatically.

TECHNOLOGIES USED

InternTrack was developed using only native front-end web technologies. No framework, library, or back-end server is used.

6.1 HTML5

HTML5 provides the structural foundation of InternTrack's single-page layout. Semantic elements organise the sidebar, main content area, and the five Kanban columns. The HTML5 Drag-and-Drop API — specifically the draggable attribute and dragstart, dragover, and drop event handlers — powers the Pipeline view's card movement between stage columns. Standard form controls handle application entry.

6.2 CSS3

CSS3 delivers InternTrack's dark developer interface with a near-black background and cyan accent colour. CSS Custom Properties manage the colour tokens for the five status colours (blue, yellow, orange, green, red) used consistently across status badges, sidebar dots, and card column headers. Flexbox handles the sidebar and main content split, and the five-column Kanban layout. CSS transitions animate sidebar item hover states and card drag feedback.

6.3 JavaScript (ES6+, Vanilla)

All application logic is implemented in Vanilla JavaScript. Key implementations include: a full CRUD system for application records stored as a JSON array in localStorage, real-time search and filter functions operating on the in-memory data array, dynamic DOM rendering of application cards and pipeline cards from the data array, drag-and-drop event handling that updates the application's status field and re-persists to localStorage, summary counter calculation across all five status categories, JSON serialisation for export and JSON.parse for import restore, and global notes auto-save on every keystroke.

6.4 HTML5 Drag-and-Drop API

The native browser Drag-and-Drop API enables the Pipeline view's core interaction. Cards are marked as draggable; dragstart captures the application ID; dragover on column elements enables dropping; and drop updates the application status, persists the change, and re-renders both the Pipeline and Dashboard views.

6.5 localStorage API

The Web Storage API’s localStorage interface persists all InternTrack data: the applications JSON array and the global notes string. Data survives page refreshes and browser restarts without any server interaction.

6.6 Netlify

The application is deployed as a static site on Netlify, providing HTTPS, a custom subdomain, and global CDN distribution.

#	Technology	Type	Purpose
1	HTML5	Markup	Structure, drag-and-drop API, form controls
2	CSS3	Styling	Dark theme, status colours, Kanban layout
3	JavaScript ES6+	Programming	CRUD, search/filter, drag-drop logic, export
4	Drag-and-Drop API	Browser API	Pipeline card movement and status update
5	localStorage	Browser API	Application data and notes persistence
6	Netlify	Platform	Static hosting and CDN deployment

CONCLUSION

InternTrack is a well-designed and practically motivated mini project that solves a genuine, daily problem for students actively pursuing internships. By combining a structured application dashboard, a drag-and-drop Kanban pipeline, a global notes section, and JSON-based data portability into a single, server-free, browser-based application, the project delivers real utility that goes well beyond a simple portfolio exercise.

The Pipeline module's drag-and-drop implementation is the project's most technically significant feature. Implementing the full HTML5 Drag-and-Drop API — from dragstart through drop, with immediate localStorage persistence and cross-view re-rendering — required a thorough understanding of browser event handling and DOM manipulation that goes beyond standard tutorial content.

The dual-view architecture — Dashboard list and Kanban Pipeline — operating on the same underlying data demonstrates sound data management thinking. Both views remain in sync because they are both rendered from the same localStorage source of truth, a pattern used in professional front-end applications.

Completing this project independently during the vacation period has been a meaningful exercise in building a real tool for a real need. The experience of designing a user interface around an actual student workflow, implementing non-trivial browser APIs, and deploying a polished product has substantially developed both technical and product design skills.

In conclusion, InternTrack is a focused, functional, and publicly deployed internship application tracker that fully achieves its stated objectives and demonstrates strong front-end development competence and practical problem-solving ability.
